RB

Michael

Looking forward to catching up on Wed night – I'm happy to shout if you want to go out, or whatever… probably would arrive around 7-7:30 depending on when I can get away.

For your heads-up - the data that seems to be partially missing is for trial types:

- N
- NP and
- NN

So it did not seem possible for me to calculate the times from the start of the trial until the response for each.

Noting that if there is no response type, then the results should show 30s as the time elapsed until the decision that there was no response. The attached file is the preferred output format…(ignore the data in that sheet)

Cath did a set manually for me to compare against (approximate times using a stopwatch – your data will be more accurate):

Date	Session	Horse	Trial#	Trial type	Time elapsed	Response type	
21-Nov	CBT2	Nix	1	P	10.27	GO	
21-Nov	CBT2	Nix	2	N	30	NOGO	
21-Nov	CBT2	Nix	3	M	9.15	GO	
21-Nov	CBT2	Nix	4	N	30	NOGO	
21-Nov	CBT2	Nix	5	P	9.81	GO	
21-Nov	CBT2	Nix	6	N	30	NOGO	
21-Nov	CBT2	Nix	7	N	30	NOGO	
21-Nov	CBT2	Nix	8	NP	9.74	GO	
21-Nov	CBT2	Nix	9	P	15.25	GO	
21-Nov	CBT2	Nix	10	N	30	NOGO	
21-Nov	CBT2	Nix	11	P	11.53	GO	
21-Nov	CBT2	Nix	12	N	24.2	GO	
21-Nov	CBT2	Nix	13	NN	30	NOGO	
21-Nov	CBT2	Nix	14	P	11.09	GO	
21-Nov	CBT2	Nix	15	N	30	NOGO	

It could be that I'm just not looking at the right things, but I think we need to re-run the data extraction process for these trial types to get the data required to calculate elapsed time.

I had been working with a query like:

```
use experiments_cb_2023_q4;

select e.cohort, e.subjectName, e.sessionNumber, e.sessionType, e.experimentType, e.comment
        , t.trialId, t.trialNumber, t.responseType, t.trialSubType, t.criterionType, t.criterionCount
--      , ev.eventType
--      , case when t.responseType = 'NOGO' then 30 else r.eventTime end as responseSeconds
        , case when t.responseType = 'NOGO' then 30 else epoch(hr.eventTime) - epoch(r.eventTime)
end as latencySeconds
        , r.eventTime, r.eventType
        , hr.eventTime as horseReleasedEventTime
        --, hr.elapsedTime as horseReleasedElapsedTime, hr.elapsedTime
from ExperimentCBsCorrected e
join TrialCBsCorrected t on t.experimentID = e.experimentId
--join EventCbsCorrected ev on ev.trialId = t.trialId
        join (
                select eventId, trialId, eventTime, elapsedTime
                from EventCBsCorrected
                where eventType like '%horse released%'
        ) hr on hr.trialId = t.trialId
```

```
) rr on rr.trialId = t.trialId
join (select trialId, eventTime
, case when eventType like 'GO for% - NP - %' then 'GO NP'
        when eventType like 'GO for% - NN - %' then 'GO N'
        when eventType like 'GO for% - P - %' then 'GO P'
        when eventType like 'GO for% - N - %' then 'GO N'
        when eventType like 'NOGO for% - NP - %' then 'NOGO NP'
        when eventType like 'NOGO for% - NN - %' then 'NOGO N'
        when eventType like 'NOGO for% - P - %' then 'NOGO P'
        when eventType like 'NOGO for% - N - %' then 'NOGO N'
        else null end as response
        , eventType
from EventCBsCorrected
) r on r.trialId = t.trialId
where e.subjectName = 'apollo'
and r.eventType like '%for Trial 1 -%'
and e.experimentType = 'Test Type 1'
--and e.comment = 'CB T 1 after RP E '
-- 11 oct - test 1 - 8.76
--and t.trialSubType = 'NP'
order by e.cohort, e.subjectNumber, e.sessionNumber, t.trialNumber;
```
